

Using SAM User Language (SAMUL)

Scripting Functionalities Utilized to Reduce SAM
User Time-On-Task and Run-Time Simulations

Presenter: Nathan Clark

Date: June 20th 2012

SAM One Day Conference

Nathan Clark

Nathan.Clark@nrel.gov

- **A part of NREL's Research Participant Program (RPP) for Solar Market Transformation in the Strategic Energy Analysis Center. Under direct supervision from Sean Ong within Energy Forecast & Modeling group, as well as, Barry Friedman within the Market Policy and Impact Analysis group.**
- **Currently Studying Electrical Engineering at University of Colorado Denver**
- **Five years experience as Commercial and Industrial Electrician in Colorado**

PV Break-Even Study Courtesy of Sean Ong
Sean.Ong@nrel.gov

Why SAMUL?

- **“The SAM User Language (SAMUL) is a built-in scripting language that allows a user to automate tasks and perform more complex analyses directly from within SAM.” – SAM Documentation**
- **Analysts performing more than “one” simulation**
- **Variable manipulation**
- **Data and File management**
- **Closed Loop I/O**
- **Multi-processing**

SAMUL Benefits

- **Is taking the time to write a script always worth it?**
 - Analyst creates own personal toolbox that can be used for future analyses
- **Can I change SAM variables on the fly in between simulations?**
 - Yes! In fact whole scenarios worth of variables can be manipulated on the fly
- **Ok. I have just created more data than I know what to do with. Now what?**
 - SAMUL can write results to files and perform simple file management
- **Is there a way to model an output variable's trend to constrain subsequent simulations?**
 - Yes. SAMUL can help solve complex non-linear problems through simple iterative methods
- **SAMUL is fast but running 100,000 simulations is going to take days. What can I do?**
 - Scripts can be easily transformed from their current state to include multiprocessing support

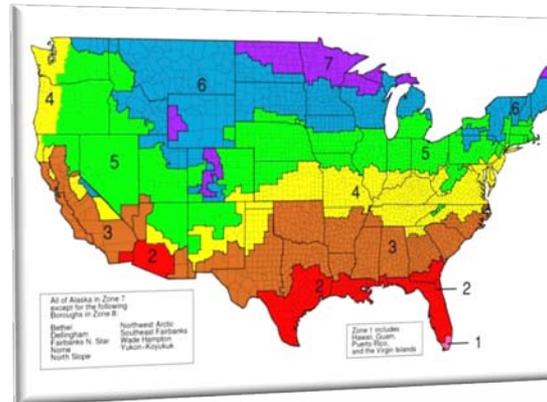

SAMUL Applied to Break-Even Study

- At what price point does PV make “economic sense”?
- How SAMUL can utilize aforementioned scripting techniques to answer the “does PV make economic sense” question.
- Break-Even study leverages SAMUL and analysis is completed with ease and significant reduction in analyst error

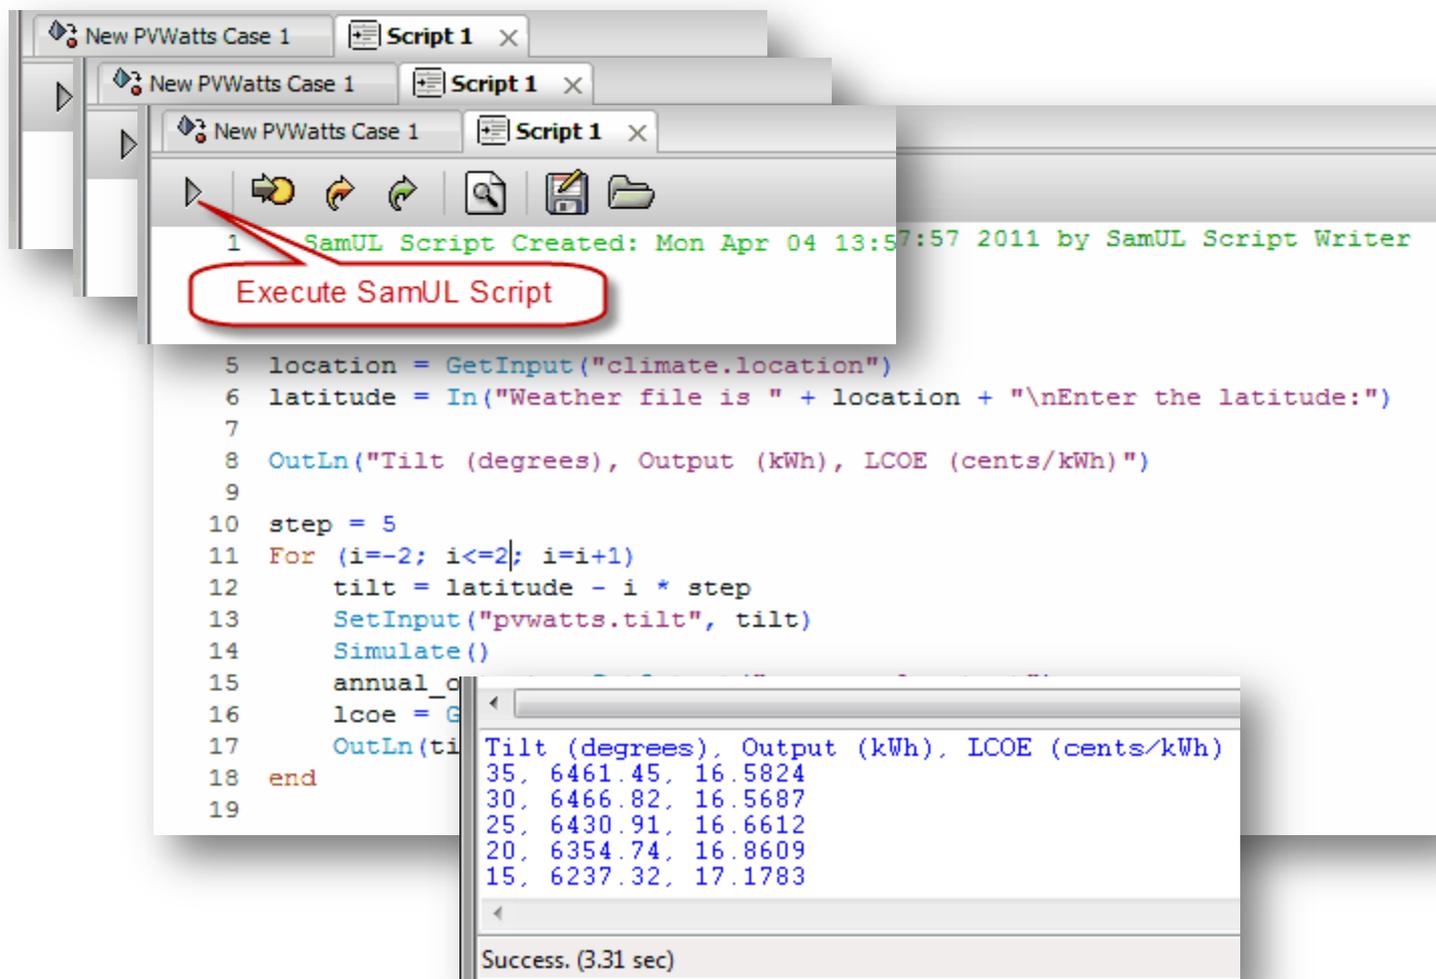

Break-Even Study Details

- 1020 U.S. TMY3 Weather Locations
- 16 different commercial building load profiles generated through E+
- 16 different ASHRAE locations specified
- DSIRE data used for state PV incentives
- Break-Even cost is defined as: total installed cost of PV in which NPV = zero (or NPB = NPC)

Setting up simple SAMUL scripts

SamUL Script Created: Mon Apr 04 13:57:57 2011 by SamUL Script Writer

Execute SamUL Script

```
5 location = GetInput("climate.location")
6 latitude = In("Weather file is " + location + "\nEnter the latitude:")
7
8 OutLn("Tilt (degrees), Output (kWh), LCOE (cents/kWh)")
9
10 step = 5
11 For (i=-2; i<=2; i=i+1)
12     tilt = latitude - i * step
13     SetInput("pvwatts.tilt", tilt)
14     Simulate()
15     annual_o
16     lcoe = G
17     OutLn(ti
18 end
19
```

Tilt (degrees)	Output (kWh)	LCOE (cents/kWh)
35	6461.45	16.5824
30	6466.82	16.5687
25	6430.91	16.6612
20	6354.74	16.8609
15	6237.32	17.1783

Success. (3.31 sec)

SAMUL I/O Variables For Break-Even

Load Inputs:

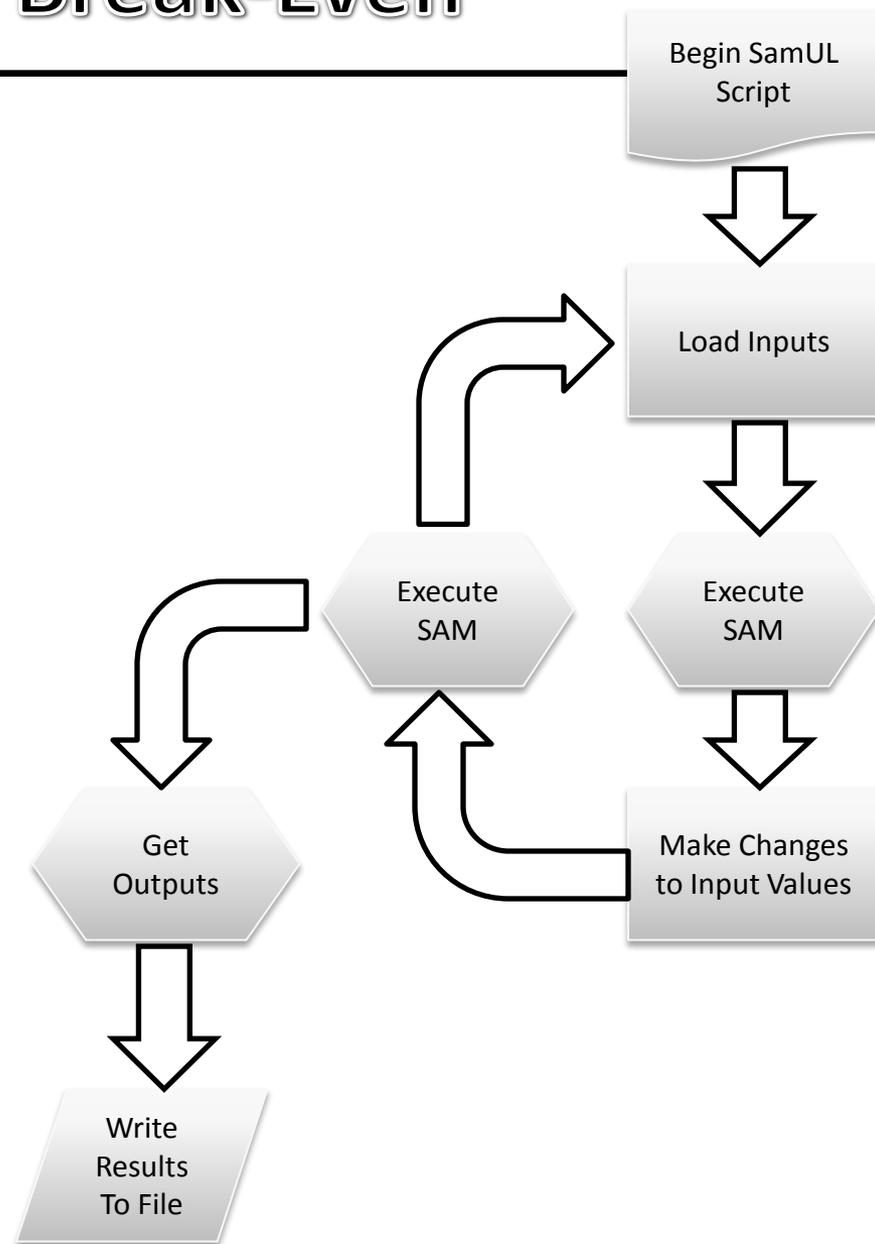

```
setinput ( "elecload.user_data", load )  
setinput("climate.location", file_list[count] )  
setinput ( "txc.itc.state.percentage.value", 20 )
```

Read Variables/Make Changes:

```
setinput ( "pv.cost.per_module", Cost - 0.001 )  
getoutput ( "sv.installed_cost_per_capacity" )  
getoutput( "sv.npv" )
```

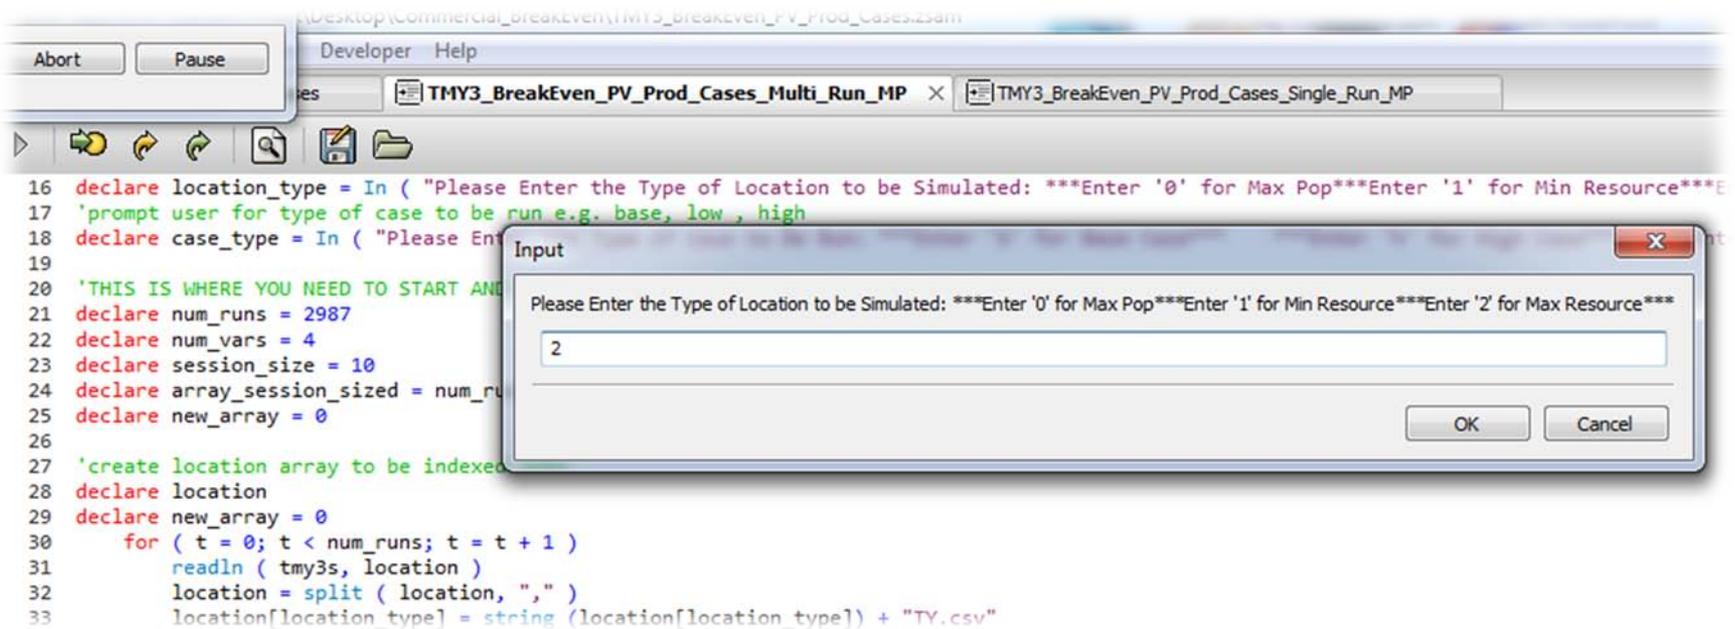

Dump Results:

```
getoutput ( "firstyear.ur.monthly.revenue_w_sys" )  
getoutput ( "system.annual.e_net" )  
writeln ( output_file, results )
```

SAMUL User Prompts

- **User Prompts: Making the Script User Friendly and Portable to other Users and Analysts**

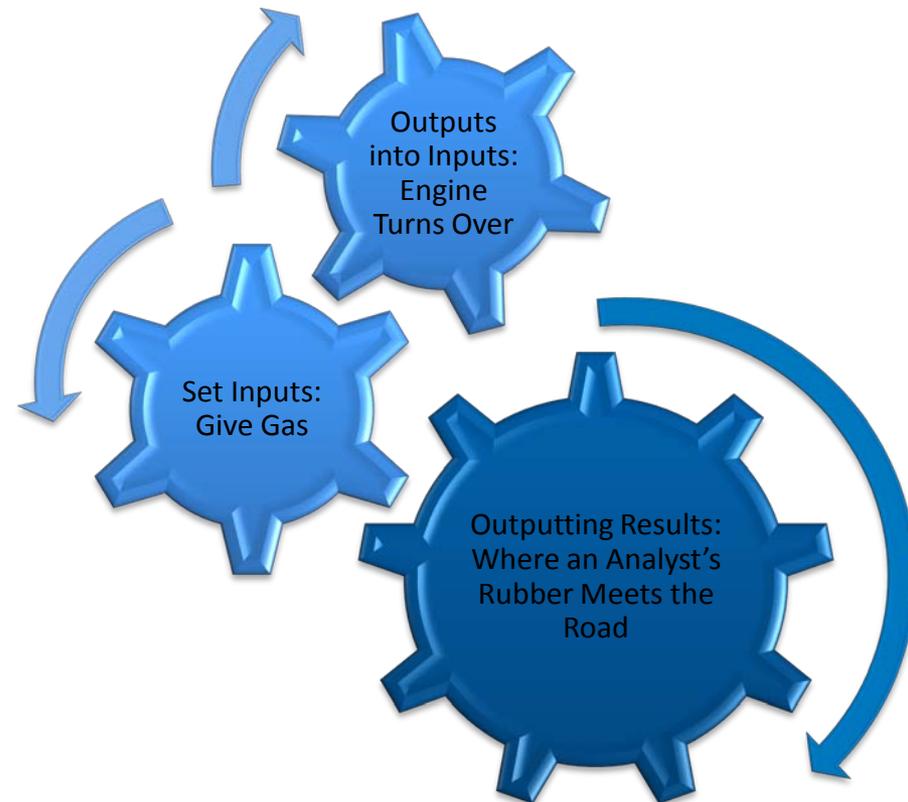

The screenshot shows a SAMUL script execution window with a user prompt dialog box overlaid. The dialog box is titled "Input" and contains the text: "Please Enter the Type of Location to be Simulated: ***Enter '0' for Max Pop***Enter '1' for Min Resource***Enter '2' for Max Resource***". The input field contains the number "2". The dialog box has "OK" and "Cancel" buttons.

```
16 declare location_type = In ( "Please Enter the Type of Location to be Simulated: ***Enter '0' for Max Pop***Enter '1' for Min Resource***E
17 'prompt user for type of case to be run e.g. base, low , high
18 declare case_type = In ( "Please Ent
19
20 'THIS IS WHERE YOU NEED TO START AND
21 declare num_runs = 2987
22 declare num_vars = 4
23 declare session_size = 10
24 declare array_session_sized = num_ru
25 declare new_array = 0
26
27 'create location array to be indexed
28 declare location
29 declare new_array = 0
30 for ( t = 0; t < num_runs; t = t + 1 )
31 readln ( tmy3s, location )
32 location = split ( location, "," )
33 location[location_type] = string (location[location_type]) + "TY.csv"
```

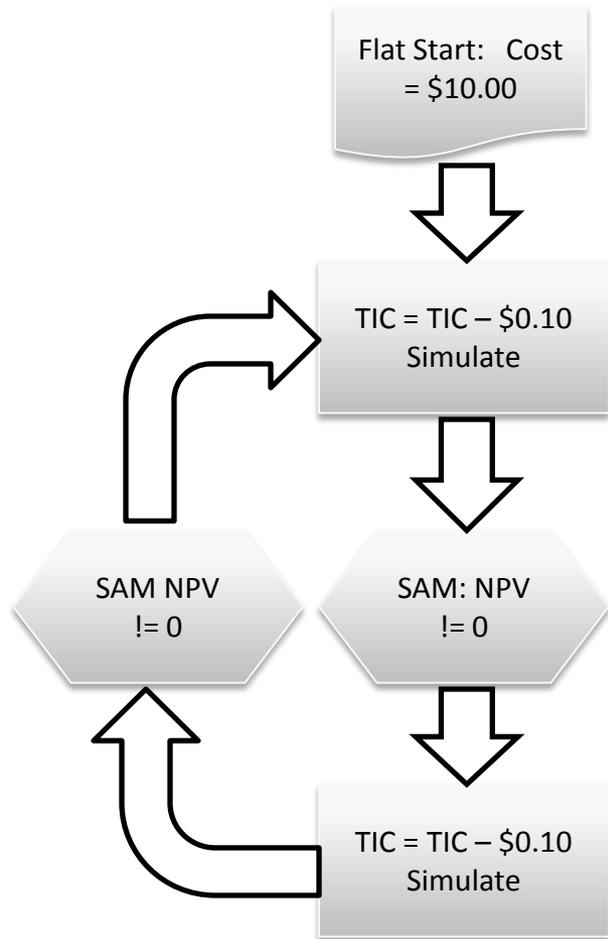

SAMUL I/O Closed Loop Analysis

While (the Net-Present-Value of PV is Less Than Zero)

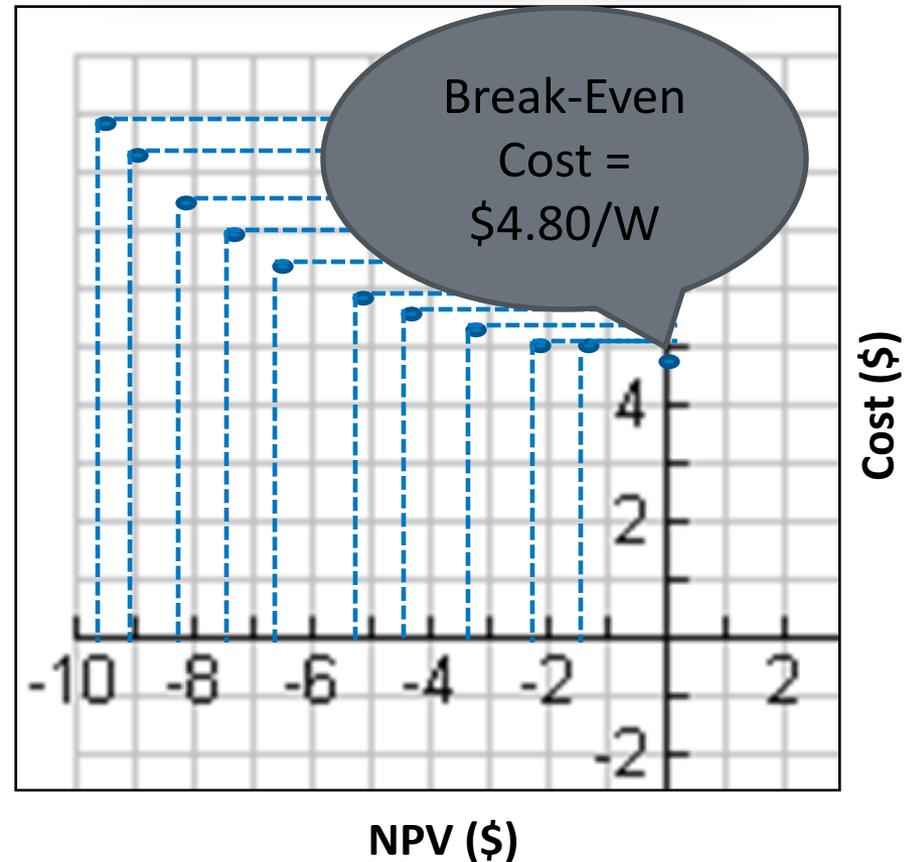

- Cost = 10
- simulate()**
- price_x[0] = getoutput ("sv.installed_cost_per_capacity")
- npv_y[0] = getoutput("sv.npv")
- simulate()**
- setinput ("pv.cost.per_module", Cost - 0.1
- simulate ()**
- price_x[1] = getoutput ("sv.installed_cost_per_capacity")
- npv_y[1] = getoutput("sv.npv")

Closed Loop Analysis of Break-Even Study

$$y - y_1 = m(x - x_1)$$

Managing Large Data and File Sets

SAMUL Multi-Processing

What about 5 hours of simulation software that runs on 8 processors? Should it simulate 40 days?

Closing Comments

- **SamUL arms the Sam user with a powerful toolset for running numerous simulations sequentially**
- **Variable manipulation through dynamic user prompts creates a portable platform that is user friendly for others**
- **Scripting Sam Results can be extended beyond to file and data management**
- **Simple closed loop I/O routines can be created for to find solutions to otherwise unsolvable problems**
- **High Performance Computing through Parallel processing is the future**

Thank You
